1 Exercises - Pollinators datasets exploration

Exercises with some pollinators datasets.

1.1 Packages import

```
[56]: import os # operating system functions
import chardet # Universal Character Encoding Detector
import requests # web requests
import numpy as np # linear algebra
import pandas as pd # data processing, CSV file I/O (e.g. pd.read_csv)
import matplotlib as plt # data visualization
import seaborn as sb # data visualization
import graphviz # graph visualization
from sklearn.model_selection import StratifiedShuffleSplit # dataset subsetting
from sklearn.preprocessing import StandardScaler
from sklearn.preprocessing import LabelEncoder # mange categorical data
from sklearn import metrics # results evaluation
from sklearn.impute import SimpleImputer # tool for dealing with missing values
import association_metrics as am # implementation of Cramer's V correlation
```

We probably will download and save more than 1 dataset so let's make a function for it

```
[20]: def DatasetDownload(dataset_url, dataset_directory_path, dataset_file_name):
    print("Download started")
    request_dataset = requests.get(dataset_url, allow_redirects=True)
    print("Download completed")
    if request_dataset.status_code != 200:
        print(f"Request status: {request_dataset.status_code}")
    else:
        print("Writing started")
        os.makedirs(dataset_directory_path, exist_ok=True)
        open(dataset_directory_path + dataset_file_name, 'wb').
        write(request_dataset.content)
        print("Writing completed")
    print("End")
    return
```

1.2 Insect Pollinator Initiative - Natural History Museum Data Portal

Graham N Stone; Alfried Vogler; Adam Vanbergen; Jacqueline Mackenzie-Dodds (2017). Dataset: Insect Pollinators Archive. Resource: Insect Pollinator Initiative. Natural History Museum Data Portal (data.nhm.ac.uk). <https://doi.org/10.5519/0062900>

Retrieved: 16:39 19 Mar 2022 (GMT)

1.2.1 IPI-NHMDP - Data download - (One shoot execution)

Let's use the original website.

Next steps are "one shoot execution", you should execute it only the first time, once did it you can go directly to *Starting points* that you'll find along the code.

```
[4]: # Dataset url
NHMDP_PI_dataset_url = 'https://data.nhm.ac.uk/dataset/
↳46e122c6-7acd-44ec-a354-81a412da419a/resource/
↳784d74b6-6b0e-4fd4-b0b5-798ac7b1a11b/download/ipifordataportal.xlsx'

# Desired directory
NHMDP_PI_dataset_directory = 'Datasets/Pollinators/NHMDP/PollinatorsInitiative'

# Desired file name
NHMDP_PI_dataset_name = 'PollinatorsInitiative.xlsx'
```

```
[12]: # Download and Save
DatasetDownload(NHMDP_PI_dataset_url, NHMDP_PI_dataset_directory,
↳NHMDP_PI_dataset_name)
```

```
Download started
Download completed
Writing started
Writing completed
End
```

1.2.2 IPI-NHMDP - Data import - Starting point

```
[5]: IPI_NHMDP_dataset = pd.
↳read_excel(NHMDP_PI_dataset_directory+NHMDP_PI_dataset_name,
↳engine='openpyxl')
```

1.2.3 IPI-NHMDP - Exploration

```
[14]: IPI_NHMDP_dataset.describe()
```

```
[14]:      Specimen No/Barcode
count      1.185400e+04
mean       1.006605e+07
```

```
std          7.403999e+03
min          1.005246e+07
25%          1.005963e+07
50%          1.006886e+07
75%          1.007182e+07
max          1.007598e+07
```

```
[5]: IPI_NHMDP_dataset.head()
```

```
[5]:
```

Could be nice try to represent these data on a geographical map... but it's a bit out of the exercise scope

1.3 Global pollinator database - Boreux & Klein - Figshare Dataset

Boreux, Virginie; Klein, Alexandra-Maria (2019): Global pollinator database. figshare. Dataset. <https://doi.org/10.6084/m9.figshare.9980471.v1>

1.3.1 GPD-F - Data download - (One shoot execution)

```
[6]: # Dataset url
GPD_F_dataset_url = 'https://figshare.com/ndownloader/files/18003863'

# Desired directory
GPD_F_dataset_directory = 'Datasets/Pollinators/Figshare/
↳GlobalPollinatorDatabase'

# Desired file name
GPD_F_dataset_name = 'GlobalPollinatorDatabase.csv'
```

```
# Description dataset url
GPD_F_description_dataset_url = 'https://figshare.com/ndownloader/files/
↳18003860'

# Desired file name
GPD_F_description_dataset_name = 'GlobalPollinatorDatabaseDescription.csv'
```

```
[21]: # Download and Save
DatasetDownload(GPD_F_dataset_url, GPD_F_dataset_directory, GPD_F_dataset_name)
```

```
Download started
Download completed
Writing started
Writing completed
End
```

```
[22]: # Download and Save description
DatasetDownload(GPD_F_description_dataset_url, GPD_F_dataset_directory,
↳GPD_F_description_dataset_name)
```

```
Download started
Download completed
Writing started
Writing completed
End
```

1.3.2 GPD - Data import - Starting point

```
[7]: GPD_dataset = pd.read_csv(GPD_F_dataset_directory+GPD_F_dataset_name)
```

read_csv on dataset description rise an error of text decoding: *UnicodeDecodeError: 'utf-8' codec can't decode byte 0x96 in position 292: invalid start byte*

Let's check the encoding

```
[27]: with open(GPD_F_dataset_directory+GPD_F_description_dataset_name, 'rb') as file:
      print(chardet.detect(file.read()))
```

```
{'encoding': 'Windows-1252', 'confidence': 0.73, 'language': ''}
```

```
[28]: with open(GPD_F_dataset_directory+GPD_F_dataset_name, 'rb') as file:
      print(chardet.detect(file.read()))
```

```
{'encoding': 'ascii', 'confidence': 1.0, 'language': ''}
```

```
[29]: GPD_dataset_description = pd.
      ↳read_csv(GPD_F_dataset_directory+GPD_F_description_dataset_name,
      ↳encoding='Windows-1252')
```

1.3.3 GPD-F - Exploration

```
[31]: GPD_dataset.describe()
```

```
[31]:      Unnamed: 0      diameter      tongue      body
count  796.000000  474.000000  293.000000  633.000000
mean    398.500000   27.781814    7.291297   11.592891
std     229.929699   31.164702    4.009739    3.862993

Maybe we can try some clustering technique on this dataset to find out some interesting relationship

Missing values Let's check how many missing values we have and somehow how are distributed

```
[38]: # Number of missing values per column
      GPD_dataset.isnull().sum()
```

```
[38]: Unnamed: 0      0
      crop          0
      type          0
      season        30
      diameter      322
      corolla        3
      colour         5
      nectar         29
      b.system        0
      s.pollination   0
      inflorescence   0
      composite       0
      visitor         0
      guild           0
      tongue         503
      body           163
      sociality       32
```

```
feeding          51
dtype: int64
```

```
[39]: # Percentage of missing values per column
      GPD_dataset.isnull().sum()/len(GPD_dataset)*100
```

```
[39]: Unnamed: 0      0.000000
      crop          0.000000
      type          0.000000
      season        3.768844
      diameter      40.452261
      corolla        0.376884
      colour        0.628141
      nectar         3.643216
      b.system       0.000000
      s.pollination  0.000000
      inflorescence  0.000000
      composite      0.000000
      visitor        0.000000
      guild          0.000000
      tongue        63.190955
      body          20.477387
      sociality      4.020101
      feeding        6.407035
      dtype: float64
```

```
[64]: # Let's check rows
      # Let's try to select only rows with some missing values
      # Note that GPD_dataset.isnull().sum() is a pandas Series
      len(GPD_dataset.isnull().sum(axis=1)[~GPD_dataset.isnull().sum(axis=1).
      ↪isin([0])])
```

```
[64]: 662
```

```
[9]: # Clearly a lot of rows since only for toungue column we have 60% of missing.
      # Lets' check rows excluding the columns with a consistent number of missing
      ↪(tounge, diametere, body)
      # To make the code more readable let's make two steps
      GPD_dataset_subset = GPD_dataset.loc[:, ~GPD_dataset.columns.
      ↪isin(["tounge", "diameter", "body"])]

      len(GPD_dataset_subset.isnull().sum(axis=1)[~GPD_dataset_subset.isnull().
      ↪sum(axis=1).isin([0])])
```

```
[9]: 132
```

```
[61]: # Let's chek how many have more than 1 missing
len(GPD_dataset_subset.isnull().sum(axis=1)[~GPD_dataset_subset.isnull().
↪sum(axis=1).isin([0,1])])
```

[61]: 17

So maybe we can try to make a first clusterization excluding this 17 rows and the 3 problematic columns.

```
[10]: GPD_dataset_subset = GPD_dataset_subset.drop(GPD_dataset_subset.isnull().
↪sum(axis=1)[~GPD_dataset_subset.isnull().sum(axis=1).isin([0,1])].index)
```

```
[70]: GPD_dataset_subset.describe()
```

```
[70]:      Unnamed: 0
count  779.000000
mean    395.503209

We have no way to infer the values of blooming season, flowers colour, nectar presence, sociality or feeding (I mean no way before the analysis of the dataset and the application of ML algorithms). So for the moment let's add a fixed value "undefined" for the missing.

```
[11]: imput_undefined = SimpleImputer(strategy = 'constant', fill_value =_
      ↪ 'undefined')
```

```
GPD_dataset_subset_0missing_array = imput_undefined.
↳fit_transform(GPD_dataset_subset)
# Note that SimpleImputer returns a numpy array
```

```
[12]: GPD_dataset_subset_ONaN = pd.DataFrame(GPD_dataset_subset_0missing_array,
↳columns = GPD_dataset_subset.columns)
```

```
[13]: GPD_dataset_subset_ONaN.isnull().sum()
```

```

We can use Cramer's V correlation value to present a heatmap of correlation between these categorical variables.

Unfortunately this metric seems a bit biased for “large” number of variables ([Bergsma, Wicher. \(2013\). A bias-correction for Cramér's V and Tschuprow's T. Journal of the Korean Statistical Society. 42. 10.1016/j.jkss.2012.10.002.](#)).

For the moment let's apply Cramer's V in a future we will improve the implementation with the bias correction.

```
[69]: CramersV_GPD_subset_object = am.CramersV(GPD_dataset_subset2_0NaN)
```

```
[70]: CramersV_GPD_subset_matrix = CramersV_GPD_subset_object.fit()
```

```
[71]: sb.heatmap(CramersV_GPD_subset_matrix)
```

```
[71]: <AxesSubplot:>
```

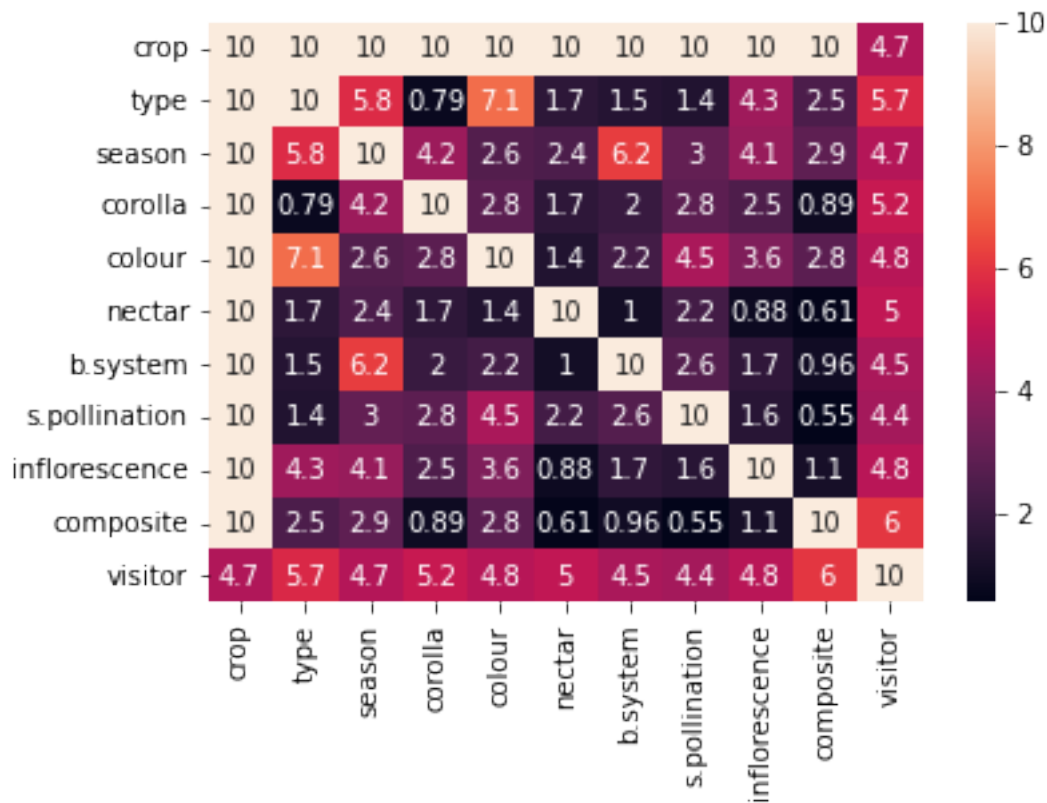

As we could expect we have an evident separation of correlation between plants and bees where the crop is highly correlated with the information about the plants characteristics; the guild is highly related with the pollinators characteristics and the “visitor” variable is the link between the two groups.

Let's focus on the two groups

```
[89]: sb.heatmap(CramersV_GPD_subset_matrix.iloc[:11,:11]*10, annot=True)
# since we know that values are between 0 and 1 we multiply for 10 to avoid most
↳ of unusefull "0."
```

```
[89]: <AxesSubplot:>
```

We can see that type (arboreous or heraceous) seems highly related to the flower colour and also quite related with the season.

The bloom system (bytheway from the values seems more a “pollination type”) seems highly related with the flower season. Despite that, the bloom system seems not related with the flower colour and the plant type.

```
[92]: sb.heatmap(CramersV_GPD_subset_matrix.iloc[10:,10:]*10, annot=True)
```

```
[92]: <AxesSubplot:>
```

Quite self-explanatory
